

DF2790 - Fixing screw holes

DF2790 fits several Mercedes-Benz Sprinters and Volkswagen LT 28, in total it is fitted to 130 models. The superceded versions of this disc are supplied with a thin fixing screw or a thick fixing screw.

The fixing screw is used only during the installation of the brake disc to hold the disc on the hub. This makes installation easier. For the function of the brake system the fixing screws are not needed.

To make stocking more efficient DF2790 has two holes for the fixing screw to cover both possibilities.
